User Story Requirements

Project: RechargeMate

Summary: RechargeMate is a mobile application designed to simplify the process of recharging prepaid mobile accounts by integrating multiple payment gateways and offering a wide range of recharge options. The app aims to provide a seamless, secure, and user-friendly experience for users to top-up their mobile credits across various telecom operators.

User Registration and Authentication

US-001: User Registration via Mobile Number

Priority: Critical

As a Prepaid mobile user, I want to register using my mobile number and authenticate via OTP, so that I can securely access the app and manage my account.

Acceptance criteria

Given a new user, when they open the app, then they should see an option to register using their mobile number.

Given a user enters their mobile number, when they request an OTP, then the system should send an OTP to the provided number.

Given a user receives an OTP, when they enter it correctly, then they should be successfully registered and logged into the app.

US-002: Social Media Login

Priority: Critical

As a Prepaid mobile user, I want to log in using my Google or Facebook account, so that I can quickly access the app without creating a new account.

Acceptance criteria

Given a user, when they choose to log in with Google, then they should be redirected to Google's authentication page.

Given a user, when they choose to log in with Facebook, then they should be redirected to Facebook's authentication page.

Given a user successfully authenticates via Google or Facebook, then they should be logged into the app.

Mobile Number Recharge

US-003: Recharge Mobile Number

Priority: Critical

As a Prepaid mobile user, I want to recharge my mobile number by selecting my telecom operator and choosing a recharge amount, so that I can top-up my mobile credits easily.

Acceptance criteria

Given a user, when they select a telecom operator, then they should see available recharge plans and offers.

Given a user selects a recharge plan, when they confirm the transaction, then the system should process the recharge and update the user's balance.

Given a successful recharge, when the transaction is complete, then the user should receive a confirmation message.

Payment Gateway Integration

US-004: Integrate Multiple Payment Gateways

Priority: High

As a Prepaid mobile user, I want to use different payment gateways to complete my recharge transactions, so that I have flexibility in choosing my payment method.

Acceptance criteria

Given a user, when they proceed to payment, then they should see options for multiple payment gateways (e.g., PayPal, Stripe).

Given a user selects a payment gateway, when they enter their payment details, then the system should process the payment securely.

Given a user, when they opt to save their payment details, then the system should securely store the information for future use.

Transaction History

US-005: View Transaction History

Priority: Medium

As a Prepaid mobile user, I want to view my past recharge transactions, so that I can keep track of my spending and recharge history.

Acceptance criteria

Given a user, when they navigate to the transaction history section, then they should see a list of past transactions with details such as date, amount, and status.

Given a user, when they select a transaction, then they should see detailed information about that transaction.

Multi-language Support

US-006: Support Multiple Languages

Priority: Medium

As a Prepaid mobile user, I want to use the app in my preferred language, so that I can understand and navigate the app easily.

Acceptance criteria

Given a user, when they open the app for the first time, then they should be prompted to select a language from English, Spanish, or Mandarin.

Given a user selects a language, when they navigate through the app, then all text should be displayed in the selected language.

Push Notifications

US-007: Receive Push Notifications

Priority: High

As a Prepaid mobile user, I want to receive notifications for successful recharges, failed transactions, and promotional offers, so that I am informed about my transactions and offers.

Acceptance criteria

Given a successful recharge, when the transaction is complete, then the user should receive a push notification confirming the recharge.

Given a failed transaction, when the system detects the failure, then the user should receive a push notification with details of the failure.

Given a promotional offer, when it is available, then the user should receive a push notification about the offer.
